

From the Director's Desk

Periods of spring-like weather have aided construction progress. As you drive by the site at 35 West Main Street you will certainly notice the elevator shaft that has been constructed. This is a big deal since the elevator will allow all floors to be fully handicapped accessible. Concrete is still being poured and the walls are taking shape.

We recently discovered that the east side Palladian window on the Carnegie building that was covered by the 1970's addition is reinforced with steel. This is work that the contractors won't have to do. The 1904 builders of the Carnegie wanted the building to be strong and last a very long time and it has done just that – 118 years and counting.
